

AMENDMENTS TO THE CLAIMS

This listing of claims will replace all prior versions, and listings, of claims in the Application:

Listing of Claims:

1. (Currently Amended). A computer program product residing on a computer readable medium, for use in a medical-imaging environment, the computer program product comprising instructions for enabling a computer to:
 - acquire ultrasound image data for at least a portion of a body organ;
 - utilize data defining a reference plane for the body organ to generate and define at least one other plane with respect to the reference plane; and
 - display automatically and substantially simultaneously at least two ultrasound images corresponding to at least one of the reference plane and the data defining the at least one other plane.
2. (Original). The computer program product according to claim 1, wherein the body organ is a fetal heart.
3. (Original). The computer program product according to claim 2, wherein the reference plane is a four-chamber view.
4. (Original). The computer program product according to claim 2, wherein the data defining the at least one other plane comprises data defining at least one of: a right ventricular outflow tract image, a left ventricular outflow tract image, a ductal arch image, an aortic arch image, a venous connections image, and a three vessel view image.
5. (Original). The computer program product according to claim 1, wherein the organ is a fetal head.

6. (Original). The computer program product according to claim 5, wherein the reference plane is a biparietal diameter of the fetal head.

7. (Original). The computer program product according to claim 1, wherein the processing by the computer is associated with sonography equipment.

8. (Original). The computer program product according to claim 1, wherein the instructions are executed by a general purpose computer.

9. (Original). The computer program product according to claim 1, further comprising instructions for causing the computer to provide a medical evaluation of the imaged organ.

10. (Original). The computer program product according to claim 9, wherein image recognition software is used to facilitate at least one of location of standardized planes and the medical evaluation.

11. (Original). The computer program product according to claim 9, wherein the medical evaluation comprises the steps of:

- recognizing a specific structure within an image;
- comparing the structure to a reference image; and
- identifying at least one of normal and abnormal anatomical characteristics of the structure.

12. (Original). The computer program product according to claim 1, wherein the display of the at least two ultrasound images comprises for each image sagittal, transverse and coronal planes.

13. (Original). The computer program product according to claim 12, wherein the display is a real time display.

14. (Original). The computer program product according to claim 1, wherein the display of the at least two ultrasound images comprises a display of a single plane associated with each of the at least one other plane.

15. (Original). The computer program product according to claim 1, wherein the display of the at least two ultrasound images comprises a real time display, of one or more standardized planes, directly from a real time volume acquired at a reference level.

16. (Currently Amended). A method comprising:
acquiring ultrasound image data for at least a portion of a body organ;
utilizing data defining a reference plane for the body organ to generate and define at least one other plane with respect to the reference plane; and
displaying automatically and substantially simultaneously at least two ultrasound images corresponding to at least one of the reference plane and the data defining the at least one other plane.

17. (Currently Amended). A system comprising:
a transducer for acquiring ultrasound image data for at least a portion of a body organ;
a processor for processing the ultrasound image data to generate and define a reference plane for the body organ and define at least one other plane with respect to the reference plane; and
a display, wherein said processor facilitates displaying substantially simultaneously at least two ultrasound images corresponding to at least one of the reference plane and the data defining the at least one other plane.
